

The Document AI is one from the google cloud services. This services digitize any scanned document. For example: book, invoice, driver license, ID card or goverment document... The Document AI analyze, read and recognize the pages, physical layout, lines, paragraphs, blocks, tables, form fields and visual elements in the scanned document. From these extracting and classifying the words and saving any data in the json file. The AI compiles the appropriate and categorized the datas with labels from the json file. From now we can use datas easily, for example: extract the customer details and payment amount from the invoice. This motor using AI, NLP and ML together. Trained in advance engine which automatically recognise and using the elements from the document. But have one option for training to the AI with own custom documents. Marking and choosing the required data in the own uploaded document and sending to the motor. The AI automatically generating value between 0 to 1 (1 is perfect), how much more need to modify for the learning. After from every uploaded documents will be automatically saved the required datas. The technology based on cloud service, therefore we can downloading, importing and using easily this motor for any programming language. For example, an agent scans a document and this automatically saves the document, or extracts important data from the document and uploads it to the records. This saves us a lot of time, we don't have to type the data one by one to enter it into the system.
